PROFINA

Sales & Management System

Technical Requirements & Product Specification

A detailed implementation brief for the development of an integrated sales, hierarchy, career, commission, lead and customer-management platform.

Document	Initial Functional and Technical Specification
Prepared for	Profina IT development colleague
Version	1.0 — Draft for implementation planning
Date	25 October 2026
Language	English
Status	Business rules captured; unresolved assumptions explicitly flagged

PRIMARY OBJECTIVE

Build one connected system that gives each sales representative and manager a reliable view of production, career progress, commissions, team performance, leads, customers and follow-up work — with auditable calculations and role-based access.

Confidential business requirements. This document describes the intended system behaviour based on the information currently provided. Items marked “Open decision” must be confirmed before production implementation.

Contents

1. Executive summary and product principles

2. Profina career hierarchy and remuneration

3. Points, sales units and product conversion rules

4. Career-year, promotion and qualification engine

5. Hierarchy, production attribution and differential commission

6. Commission, reserve and subsidy calculations

7. Employee management, goals and dashboards

8. Employee performance profiles and coaching

9. Lead management and sales pipeline

10. Customer CRM and retention automation

11. Tasks, reminders, forecasting and alerts

12. Roles, permissions, privacy and audit

13. Core data model and recommended fields

14. Key workflows and acceptance criteria

15. Development priorities and phased delivery

16. Open questions and implementation assumptions

17. Appendix: worked examples and formulas

1. Executive Summary and Product Principles

Profina is a multi-level sales organisation. The system must model a permanent reporting structure, seven career levels, product-based production points, sales units (AE), career qualification rules, differential commissions across the hierarchy, a 10% cancellation reserve, monthly subsidies, employee goals, leads and customer relationships.

The platform should not be a set of disconnected spreadsheets. It should have one consistent data model so that a validated contract or production record can feed points, AE, commission calculations, career progress, team dashboards and reporting without duplicate manual entry.

Primary outcomes

- Calculate points and AE consistently from recorded production and product type.
- Show personal production separately from team production and career-eligible points.
- Calculate gross commission, differential commission, reserve and estimated payable amount transparently.
- Maintain the permanent hierarchy and correctly attribute production through all ancestor levels.
- Track career progress, including personal career-year deadlines, the transition to calendar years and the 50% structure cap.
- Enforce the minimum 10% KV (health-insurance) points requirement for every target career level.
- Give employees and managers role-appropriate dashboards, targets, performance trends and coaching actions.
- Manage lead allocation and track the lead journey through contact, appointment, offer and result.
- Maintain a customer overview and enable carefully controlled birthday, holiday and service emails.
- Provide traceability: users must be able to understand where every number came from and who changed the underlying record.

Product principles

- Calculation-first: commission and career rules must be implemented as tested business logic, not manually copied formulas in screens.
- Explainable: each calculated number should have a drill-down to its source records, applicable rate, reserve and rule.
- Role-aware: users see only the records and financial details their role permits.
- Configurable: rates, qualification thresholds, product conversion factors, templates and targets should be configurable by an authorised administrator, with effective dates and change history.
- Historical integrity: changes to a rate or hierarchy must not silently rewrite past approved statements. Recalculation rules and correction workflows must be explicit.
- Build incrementally: hierarchy, production and commission correctness must come before advanced automation.

Important scope boundary

The existing Profina/partner contract portal is believed to already show policy or contract data. The new system should initially be a central relationship, sales and management layer, not necessarily a replacement for the official policy administration system. Integration feasibility and the source of truth must be established before development.

2. Profina Career Hierarchy and Remuneration

Profina has seven career levels. Career level determines the standard remuneration rate per point and the maximum monthly subsidy for full-time sales representatives. Subsidies are not automatic entitlements: they must be covered by sufficient business volume and may vary by individual.

Level	German title	Abbreviation	Promotion threshold	Rate per point	Maximum monthly subsidy
1	Finanzassistent	FA	Entry level	€28	No standard maximum specified
2	Fachberater	FB	100 P / 2,800 AE	€56	€500
3	Teamleiter	TL	300 P / 8,400 AE	€70	€1,000
4	Organisationsleiter	OL	750 P / 21,000 AE	€92	€1,500
5	Direktionsleiter	DL	1,500 P / 42,000 AE	€112	€2,500
6	Regionalleiter	RL	4,000 P / 112,000 AE	€132	€3,500
7	Vertriebsdirektor	VD	9,000 P / 252,000 AE	€144	€6,000

Business rule: 1 point (P) = 28 sales units (Absatzeinheiten, AE).

The career thresholds above are cumulative threshold values for the target level as currently described. The system must keep each person's achieved career level once earned; levels are not required to be maintained. The precise way points are accumulated for each promotion cycle is described in Section 4.

Subsidy handling

- Store the maximum subsidy by career level as a reference ceiling.
- Store the actual approved monthly subsidy separately for each person; it may be lower than the level maximum and can vary based on business volume.
- Track subsidy effective dates, approval status, amount, eligibility basis and any review notes.
- Show subsidy separately from point-based commission. Do not assume that subsidy itself creates points or AE.
- Where a profitability view is used, subtract only costs that have actually been recorded or explicitly configured; do not treat a maximum subsidy as a paid amount.

Open decision: confirm whether a subsidy is prorated, paused, reclaimed or adjusted in months when the business-volume requirement is not met, and who has authority to approve it.

3. Points, Sales Units and Product Conversion Rules

The system must calculate points from the relevant product base and display the calculation so that a user can verify it. Product conversion rules should be configurable and versioned rather than hard-coded in multiple places.

3.1 Life insurance (LV)

Formula: Points = monthly contribution × 12 × policy term in years ÷ 4,000.

Example: €100 monthly × 12 × 35 years = €42,000 total contribution basis; €42,000 ÷ 4,000 = 10.5 points.

The currently stated maximum term used in the formula is 35 years. The actual policy term must be recorded and validated. Confirm whether fractional points are retained at full precision or rounded for display only.

3.2 Health insurance (KV)

Formula: Points = monthly contribution ÷ 28.

Example: €700 monthly contribution ÷ 28 = 25 points.

KV points must also be separately tagged for the 10% health-insurance qualification requirement. Do not infer that all points are KV points simply because the user's total points include health insurance; the product category must be explicit.

3.3 Property/casualty insurance (Sach)

Formula: Points = annual net premium ÷ 200.

Example: €1,000 annual net premium ÷ 200 = 5 points.

The system must store the premium basis, period, gross/net status and currency so the calculation can be audited. The conversion rule specifically uses annual net premium.

3.4 Electricity, gas and motor insurance (Kfz)

Current rule: these product categories do not generate points or AE under the rules provided. Remuneration for these products is out of scope for the first version of the point/career engine and will be specified separately later.

The software should still allow these business lines to be recorded for sales activity, revenue and customer relationship purposes, without incorrectly adding them to career points.

3.5 Points-to-AE conversion

Formula: AE = points × 28. The system should retain the underlying exact calculation and define one approved rounding policy. Do not round intermediate values differently in different screens.

Open decisions for product calculation

- Should fractional points be retained to at least two decimal places, and how should they be displayed?
- How are cancellations, reductions, policy changes and corrected premium values reflected in points and historical statements?
- Is the point basis taken from submitted business, issued contracts, accepted contracts, paid premium, or another milestone?
- Are there product-specific exceptions, minimums, maximums or special rounding rules beyond those listed here?

4. Career-Year, Promotion and Qualification Engine

Career periods are individual for the first year and then move to calendar-year cycles. Achieved career levels remain permanent once earned, while the points used for the next promotion cycle reset at the applicable period boundary. Historical production remains stored and reportable.

4.1 First personal career year

Each employee has an individual start date. During the first personal career year, the employee has one year from the start date to qualify for a target level.

Example: a person starts on 1 November 2026. Their first personal career year runs from 1 November 2026 to the transition date around 1 November 2027. The precise boundary convention (inclusive/exclusive date and time) must be implemented consistently and confirmed.

4.2 Calendar-year cycles after the first year

From the second cycle onward, the career cycle follows the calendar year, 1 January through 31 December. For the example above, the intended second regular cycle is 1 January 2028 through 31 December 2028. The partial period between the end of the first personal year and the next 1 January requires a confirmed transition rule.

Recommended implementation: store a career-period record for each employee with period type, start date, end date, status and the rule version used. Do not derive all historical periods from the current start date alone.

4.3 Points reset and history

- At the end of the applicable career period, reset only the points counted for the next promotion cycle.
- Do not delete or reset production history, contracts, AE history, commission statements, lead history or customer records.
- Preserve already achieved career level permanently unless an authorised administrative correction is required.
- Display both current-cycle career points and all-time/historical production, clearly labelled to avoid confusion.
- Keep a history of career level, effective date, promotion evidence and any manual override.

4.4 Minimum KV requirement for each target level

For every career level, at least 10% of the target level's required career points must come from health insurance (KV) business. The requirement is based on career points, not on monetary revenue.

Target level	Total points required	Minimum KV points (10%)
FB	100	10
TL	300	30
OL	750	75
DL	1,500	150
RL	4,000	400
VD	9,000	900

Example: a candidate for FB has 100 total points but only 7 KV points. They have not met all promotion requirements; at least 3 more KV points are required. A progress dashboard must show total-point progress and KV-point progress separately.

The same qualification logic should be applied to each target level, with the relevant threshold. Confirm whether KV points may also count toward the total points (the examples strongly imply yes) and whether any other product-specific qualification exists.

4.5 The 50% structure cap from TL onward

From career level TL (level 3) onward, when qualifying for the next level, no more than 50% of the target-level point requirement may be credited from any one individual structure. Production from multiple distinct structures can contribute, and personal production may contribute as well.

Example: a TL needs 750 points to qualify for OL. Maximum credited from any single structure = 50% × 750 = 375 points. If one subordinate structure produces 800 points, only 375 of those points may be credited to this TL's promotion requirement. Remaining points must come from personal production and/or other structures, subject to the same per-structure cap.

Implementation requirement: the system must distinguish (a) actual production, (b) production attributed through the hierarchy, and (c) promotion-eligible points after applying the per-structure cap. The cap must be calculated against the candidate's target level, not the current level.

Open decision: the business example establishes the cap at TL-to-OL. Confirm whether the cap applies to promotion attempts starting at TL and every higher level, and whether the 10% KV minimum is checked before or after the structure cap is applied. The safest provisional implementation is to calculate both total eligible points and eligible KV points after attribution/cap rules, then prevent promotion until both thresholds pass.

5. Hierarchy, Production Attribution and Differential Commission

The business is a multi-level structure. Employees remain permanently attached to their original reporting structure. If a subordinate develops their own team, those new employees are indirectly part of the higher-level leader's structure through that subordinate. A leader continues to receive differential commission through all levels, according to the commission difference between the relevant levels.

5.1 Permanent hierarchy

- Every employee has one direct manager/parent in the sales hierarchy, unless an approved exception is configured.
- The structure must support multiple levels and nested teams.
- Subordinates are not removed from an upstream leader's structure simply because they become team leaders themselves.
- Users must be able to view both direct reports and all indirect reports, subject to role permissions.
- Hierarchy changes must be effective-dated and audited. A transfer must not silently rewrite historic attribution or paid statements.

5.2 Standard remuneration rates used for differential calculation

Level	Rate per point
FA	€28
FB	€56
TL	€70
OL	€92
DL	€112
RL	€132
VD	€144

The stated rule is that differential commission is the difference between the applicable remuneration rates. For a direct FB above an FA: €56 – €28 = €28 per FA point. For a direct TL above an FB: €70 – €56 = €14 per FB point. For a direct DL above a TL: €112 – €70 = €42 per TL point.

5.3 Worked hierarchy example provided by Profina

Hierarchy: DL → TL → FB → FA. The FA produces 10 points.

Recipient	Rate difference stated	Gross differential for 10 points
FB over FA	€56 – €28 = €28/P	€280
TL over FB	€70 – €56 = €14/P	€140
DL over TL	€112 – €70 = €42/P	€420

Important implementation note: the example describes a differential at each level based on the rate difference between the recipient and the next relevant level in the hierarchy. The system must define the exact production base on which each ancestor's differential is calculated. In particular, the provided example lists the DL's €42/P difference over the TL; this is consistent with DL rate €112 and TL rate €70. Do not assume the DL receives a differential equal to the difference between DL and the original FA unless the formal Profina commission rules say so.

5.4 Recommended commission ledger design

- Create one commission ledger entry per producer, product/production record, recipient and applicable commission rule.

- Store producer ID, recipient ID, direct/indirect relationship, producer career level, recipient career level, production points, rate basis, gross rate, differential rate, gross amount, reserve amount, net payable estimate, statement period and status.
- Prevent duplicate payments when a production record rolls up through multiple ancestors.
- Allow drill-down from a manager’s total to each underlying producer and transaction.
- Support recalculation and correction entries without erasing the original ledger history.

Open decision: the supplied worked example does not fully define every possible pair of career levels and every intermediate reporting configuration. Build the calculation from a configurable rate table and confirm the formal rule for which ancestor/descendant rate comparison is used at each level.

6. Commission, Reserve and Subsidy Calculations

6.1 10% cancellation reserve

A 10% cancellation reserve is withheld from every commission amount, including personal production commission and differential commission.

Example: an FB earns 10 personal points. Gross commission = 10 × €56 = €560. Reserve = €56. Amount after reserve = €504, before any other deductions or adjustments.

Example for differential commission: an FB earns €28/P on 10 points generated by an FA. Gross differential = €280. Reserve = €28. Amount after reserve = €252.

6.2 Commission calculation requirements

- Display gross commission, 10% reserve and amount after reserve separately.
- Apply the reserve consistently to all commission types covered by the rule.
- Keep the reserve as a separate ledger component, not as a hidden reduction in the rate.
- Allow an authorised administrator to record releases, adjustments, cancellations or clawbacks if these are part of Profina's later-defined process.
- Show commission status clearly: calculated, reviewed, approved, exported/paid, adjusted or disputed, if those statuses are adopted.

6.3 Personal and team earnings

A leader dashboard should separate the leader's own production commission from differential commissions generated by the team. It should also separate the actual approved subsidy from commission, and should never label gross commission as take-home income.

Recommended financial views

- Own production: points × own career-level rate.
- Direct team differential: calculated for eligible direct reports.
- Indirect team differential: calculated for deeper levels using the applicable rule.
- Total gross commission: sum of relevant ledger entries.
- Reserve withheld: 10% of applicable gross commission.
- Amount after reserve: gross commission minus reserve, before other adjustments.
- Subsidy: actual approved monthly amount, shown separately.
- Optional management contribution view: commission generated for the leader minus actual recorded subsidy and explicitly configured costs.

6.4 Monthly subsidy administration

The maximum subsidy by level is a ceiling, not a guaranteed payment. Store actual amounts individually and make the business-volume coverage decision auditable. Avoid automatically paying the maximum amount merely because the employee has reached a particular career level.

7. Employee Management, Goals and Dashboards

The employee module is the central workspace for representatives and leaders. Each user should have a personal dashboard, while managers can see their direct and indirect structure according to access rights.

7.1 Employee directory

- Employee name, unique employee ID, start date, active/inactive status and contact details.
- Current career level, career-level history and direct manager.
- Direct reports and indirect team structure.
- Current career-period points, KV points, AE and progress to next level.
- Monthly actuals versus targets, recent activity and performance trend.
- Commission summary and approved subsidy, visible only to authorised users.
- Links to employee profile, leads, customer relationships, goals and coaching notes.

7.2 Monthly goal submission

Each employee should submit monthly goals. A manager should be able to review, comment on, approve or return goals for revision. Store each submitted version and the approval trail.

Suggested goal fields

- Target points and AE.
- Target KV points.
- Target number of appointments booked and held.
- Target number of offers/proposals and completed sales.
- Target lead follow-up volume.
- Expected gross production and optional commission forecast.
- Personal development goal or training focus.
- Employee comments and manager comments.

Goal values should be configurable by level or team, but targets should not be confused with formal career thresholds. For example, a manager may set a monthly target of 20 points even though a formal promotion requires 100 points over the applicable career period.

7.3 Dashboards by role

Dashboard	Key contents
Employee	Own points, AE, KV points, monthly targets, next-level progress, leads, appointments, tasks and own commission summary.
Team leader	Direct/indirect structure, team production, promotion readiness, monthly goal completion, activity funnel, overdue follow-ups and differential commission.
Higher-level leader	Multi-team production, team comparisons, career pipeline, structure contribution, forecast, subsidy overview and exception alerts.
Administrator	Rule configuration, hierarchy exceptions, user access, data quality, recalculation queue, audit trail and integration status.

7.4 Career progress display

For every employee, show at least: current level; target next level; total points required; points currently credited in the active period; remaining points; KV points required and achieved; per-structure credited points and caps where applicable; period end date; and whether the current pace is sufficient to reach the target.

7.5 Forecasting

A forecast should be labelled as an estimate, not a guarantee. It can use current monthly pace, historical pace, open opportunities and planned appointments. The calculation method should be visible and should not alter official career or commission results.

8. Employee Performance Profiles and Coaching

Each employee profile should help a leader understand output, activity, efficiency, trend and support needs. It should not make opaque or automatic employment decisions.

8.1 Performance dimensions

Dimension	Example metrics
Production	Points/month, AE/month, product mix, personal production trend, team production contribution.
Activity	Appointments booked, appointments held, cancellations/no-shows, consultations completed, follow-ups performed.
Conversion	Appointment-to-sale conversion, offer-to-sale conversion, lead-to-appointment conversion.
Economics	Gross commission generated, differential commission attributable to the employee, approved subsidy and recorded direct costs where available.
Career progress	Current level, time in role, points remaining, KV qualification progress, eligible structure contribution.
Quality and service	Document completion, follow-up timeliness, customer service tasks, cancellations or persistency indicators where data is lawfully available.
Development	Training needs, coaching actions, agreed objectives and next review date.

8.2 Conversion funnel

Track the funnel from lead → contact attempt → reached → appointment booked → appointment held → consultation completed → offer/proposal → sale/contract. Define each stage so all employees count events consistently.

Example: 20 held appointments and 8 appointments that resulted in a sale produce a simple appointment-to-sale conversion rate of 40%. The interface must state the denominator and time window used. If a sale is linked to a prior appointment or several appointments, use a documented attribution rule to avoid misleading results.

8.3 Coaching insights

- Low activity: suggest reviewing weekly planning, lead availability and follow-up routines.
- High activity but low conversion: suggest reviewing needs analysis, qualification, product knowledge, objection handling and follow-up quality.
- Good conversion but low volume: suggest increasing qualified appointments or lead capacity.
- Career gap driven by KV points: show the exact KV shortfall and a compliant development action.
- Declining trend: compare the latest period with an appropriate prior period and prompt a conversation rather than asserting a cause.
- Overdue tasks: surface specific overdue actions and their age.

8.4 Manager notes and review cadence

- Record a coaching conversation date, participants, agreed actions, owner and due date.
- Allow private manager notes with strict permissions; distinguish these from notes visible to the employee.
- Provide a monthly review checklist and optional quarterly development review.
- Track completion of agreed actions and show them on the employee's next dashboard.
- Retain only information needed for a legitimate business purpose and establish a retention policy.

8.5 Fairness and transparency

Performance indicators should support human judgement. The system should not automatically recommend dismissal or rank employees without context. Make metric definitions visible, consider tenure and role, and restrict sensitive coaching notes to authorised users.

9. Lead Management and Sales Pipeline

The lead system should support leads received by Profina as well as leads entered by a manager or representative. Managers can assign leads to employees and reassign them when justified. Every meaningful action should be tracked.

9.1 Lead record fields

Field group	Recommended fields
Identity	Lead ID, first/last name, company if relevant, phone, email, preferred contact channel.
Source	Lead source, campaign, referral, import batch, received date, source cost if known.
Ownership	Created by, current owner, assigning manager, assigned date, reassignment history.
Qualification	Product interest, region, contact preference, qualification status, priority, consent/legal basis fields where applicable.
Pipeline	Current stage, stage entry dates, next action, next-action due date, loss reason, result.
Activity	Calls, emails, contact attempts, reached/not reached, appointment records, notes and outcome.
Conversion	Linked customer ID, linked contract/production record, product, point/AE result where relevant.

9.2 Suggested lead stages

New → Assigned → Contact attempted → Contacted → Qualified → Appointment booked → Appointment held → Offer/proposal → Won/converted or Lost/not pursued. “Nurture/follow up later” can be a separate state. Stage definitions and mandatory fields should be configurable.

9.3 Lead assignment

- Manual assignment by the leader to a selected employee.
- Self-created leads with creator and owner recorded.
- Optional future auto-assignment by availability, geography, product expertise, lead capacity or response performance.
- Reassignment with a required reason and an audit record.
- Configurable SLA: for example, a lead must receive a first attempt within a set number of business hours. The SLA value should be chosen by Profina, not hard-coded.
- Alerts for unassigned leads, overdue first contact and leads without a next action.

9.4 Lead performance analytics

- Lead count and lead age by source, employee, team and stage.
- Contact rate, appointment booking rate, show rate, sale conversion rate and average time to first contact.
- Production/points and commission generated by source when reliably linked.
- Cost per lead and cost per sale if source costs are available.
- Lost reasons and performance of each campaign/source over time.

9.5 Duplicate handling

Before creating a new lead, check for likely matches using phone, email and name. Do not silently merge records. Present a duplicate warning and let an authorised user link or merge them with an audit trail.

10. Customer CRM and Retention Automation

Create a central customer list containing core customer data and relationship history. The system should complement the existing contract portal and link to it where possible. Avoid manually duplicating all policy details if they can be synchronised from a reliable source.

10.1 Customer profile

- Unique customer ID, full name, date of birth when needed, contact details and preferred communication channel.
- Responsible adviser, team/structure association and relationship status.
- Links to existing contracts or the external contract portal, plus a synchronisation timestamp and source system.
- Contact and consultation history, service requests, notes and next follow-up.
- Communication preferences, consent/permission records, opt-out status and email delivery history.
- Relevant upcoming service dates and customer-care tasks.

10.2 Birthday and holiday emails

Support automated personalised email templates for birthdays, selected holidays and year-end greetings. Provide preview, test-send, schedule, pause and audit functions. The system must check the customer's communication preferences and applicable legal basis before sending.

- Template editor with approved reusable templates and merge fields (e.g. preferred name).
- Central schedule and timezone-aware send window.
- Suppression list for opt-outs, invalid addresses and contacts who should not receive automated messages.
- Test mode and preview before activation.
- Delivery, bounce and failure logs where the email provider makes these available.
- Per-customer send history and a global pause/kill switch.
- Role-based approval for changes to templates and bulk campaigns.

10.3 Service and retention reminders

Create tasks for agreed customer reviews, pending documents, follow-up after advice and other legitimate service events. Use configurable dates and responsible owners. Do not make unverified assumptions about policy anniversaries or contract data; use the official source system or manual confirmation.

10.4 Integration strategy

- Identify the existing contract portal and determine whether it offers an API, exports, webhooks or scheduled reports.
- Define the authoritative source for customer identity, contract status, product details and policy dates.
- Use stable external IDs to prevent duplicates and track sync status/errors.
- Build a read-only integration first if write access is unavailable or risky.
- Never scrape or bypass access controls without explicit authorisation.

10.5 Privacy and communications

Customer personal data and insurance-related information require careful access control, data minimisation, retention rules and documented lawful processing. Birthday/holiday messages should not be treated as automatically permissible for every customer. Have Profina's responsible privacy/legal contact validate the intended basis and content before enabling bulk sending.

11. Tasks, Reminders, Forecasting and Alerts

A shared task engine should support the other modules rather than building a separate reminder feature in every screen.

11.1 Task fields

- Task ID, title, type, linked employee/lead/customer/goal/commission record, owner, creator, due date, priority, status and completion timestamp.
- Reminder schedule, escalation rule, completion notes and recurrence where needed.
- Visibility scope and audit trail.
- Task source (manual, lead SLA, customer event, goal review or system alert).

11.2 Recommended automated alerts

Trigger	Suggested action
Career period approaching its end	Notify employee and manager; show remaining total/KV points and structure-cap limitations.
Monthly goal is behind pace	Show actual versus target and estimated month-end result.
Lead not contacted within SLA	Notify owner; optionally escalate to manager.
Lead has no next action	Create a reminder or flag it on the pipeline dashboard.
Customer birthday/holiday email scheduled	Check suppression/permission rules, then send or log why suppressed.
Employee has overdue tasks	Show count, age and related records.
Subsidy review due	Notify authorised manager/admin to review actual amount and coverage.
Calculation exception	Place the affected record in an admin review queue rather than silently using a default.
Data sync failure	Notify authorised support/admin and retain the failed payload metadata safely.

11.3 Notification controls

Users should be able to configure non-critical notification preferences. Critical workflow notifications (such as required approvals or calculation exceptions) should remain visible to authorised users even if optional email notifications are disabled.

12. Roles, Permissions, Privacy and Audit

The system serves multiple roles with different needs. Access should follow least privilege: a user receives only the information and actions needed for their role. The final role matrix must be approved by Profina before go-live.

12.1 Suggested roles

Role	Typical access
Financial adviser / sales representative	Own profile, own targets, own production and commission summary, assigned leads and permitted customer records.
Team leader	Direct and indirect team performance, team career progress, lead assignment, goals and authorised differential commission information.
Higher-level leader	Multi-team/structure roll-up, performance trends and financial summaries within their authorised hierarchy.
Administrator	User provisioning, rule configuration, controlled correction tools, integration monitoring and audit access.
Commission/finance operator	Commission statements, reserve, subsidy and reconciliation data for assigned scope; no unnecessary access to coaching notes.
Privacy/compliance reviewer	Access to relevant consent, communication and audit information as authorised.

12.2 Permission rules

- Separate view, create, edit, approve, export and delete permissions.
- Use hierarchy-based access for employee and customer records, with explicit exceptions and an audit trail.
- Restrict detailed commission and subsidy amounts to users who need them.
- Restrict private coaching notes and sensitive customer information more tightly than ordinary profile fields.
- Use soft deletion or archival for operational records; financial and audit records should not be casually deleted.
- Require stronger authentication for administrators and protect exports/downloads.

12.3 Audit trail

Log changes to career level, reporting line, production values, product category, point conversion rule, commission rate, reserve, subsidy, lead ownership, customer consent and email templates. Each audit entry should include actor, timestamp, old value, new value, reason and related record.

12.4 Data protection and security

- Encrypt data in transit and at rest where supported by the chosen infrastructure.
- Use secure authentication, session management, backups and tested recovery procedures.
- Minimise personal data and establish retention/deletion rules approved by Profina.
- Keep production and test data separated; use anonymised or synthetic data for development/testing.
- Record exports and bulk actions for sensitive datasets.
- Implement a process to correct inaccurate data and handle access or deletion requests where applicable.
- Have the applicable German/EU privacy, insurance-distribution and records requirements reviewed by Profina’s responsible advisers.

13. Core Data Model and Recommended Fields

The following is a logical model, not a mandate for a specific database technology. Use stable internal IDs, referential integrity, timestamps and effective dates. Financial and career calculations should be reproducible from the stored source facts and rule versions.

13.1 Core entities

Entity	Purpose / key fields
Employee	employee_id, name, start_date, status, current_level_id, direct_manager_id, timezone, contact details, created_at, updated_at.
CareerLevel	level_id, name, abbreviation, point_rate, max_subsidy, threshold_points, effective_from, effective_to.
HierarchyAssignment	employee_id, manager_id, effective_from, effective_to, change_reason, approved_by.
CareerPeriod	period_id, employee_id, period_type, start_date, end_date, status, rule_version.
ProductionRecord	production_id, producer_id, product_category, product_reference, premium_amount, premium_period, net_or_gross, term_years, production_date, status, source_system_id.
PointCalculation	production_id, rule_version, calculated_points, calculated_AE, KV_points, calculation_details, calculated_at.
CareerCredit	employee_id, period_id, source_structure_id, gross_points, eligible_points, eligible_KV_points, cap_applied, calculation_version.
CommissionLedger	ledger_id, production_id, recipient_id, producer_id, commission_type, rate_basis, gross_amount, reserve_amount, net_after_reserve, period, status.
SubsidyRecord	employee_id, effective_month, maximum_amount, approved_amount, approval_status, coverage_basis, approver, notes.
MonthlyGoal	employee_id, month, target_points, target_KV_points, target_AE, target_appointments, target_sales, target_followups, status, approval history.
Activity / Appointment	activity_id, owner_id, lead_id/customer_id, type, scheduled_at, completed_at, outcome, notes, linked_sale_id.
Lead	lead_id, identity/contact fields, source, owner_id, assigned_by, stage, created_at, next_action_at, outcome, linked_customer_id.
LeadActivity	activity_id, lead_id, actor_id, action_type, timestamp, result, notes.
Customer	customer_id, name, date_of_birth if needed, contact details, owner_id, structure_id, preferences, consent state, external_system_id.
ContractLink	customer_id, external_contract_id, source_system, product, status, last_synced_at, deep_link if available.
Task	task_id, type, owner_id, linked_record_type/id, due_at, status, priority, reminder config.
EmailTemplate / SendLog	template_id, version, purpose, approved_by; send_id, customer_id, sent_at, outcome, suppression reason.
AuditEvent	actor_id, action, entity_type/id, timestamp, old/new values, reason, correlation_id.

13.2 Data model principles

- Store raw production inputs separately from calculated points so rules can be audited and recalculated.
- Version all rates and conversion rules with effective dates.
- Store career credits separately from actual production because structure caps may reduce promotion-eligible credit without changing the underlying production.
- Use a ledger model for commissions: corrections should create adjustment/reversal entries rather than erase paid history.
- Use explicit product categories and a flag for whether a product contributes to points, AE and KV qualification.
- Store both the direct manager relationship and the effective-dated hierarchy history.
- Use a unique source-system reference for imported contracts/customers to prevent duplicate ingestion.

14. Key Workflows and Acceptance Criteria

These are proposed acceptance criteria to make the business rules testable. Each item should become a test case before release.

14.1 Production entry and calculation

- Given an LV record with €100 monthly premium and 35-year term, the system calculates 10.5 points using the configured LV formula.
- Given a KV record with €700 monthly premium, the system calculates 25 points and tags them as KV points.
- Given a Sach record with €1,000 annual net premium, the system calculates 5 points.
- Given a product category of electricity, gas or Kfz under current rules, the record creates no career points or AE.
- Every calculated result displays the inputs, formula and rule version used.
- AE equals points multiplied by 28, using the agreed rounding policy.

14.2 Personal commission and reserve

- An FB with 10 personal points receives €560 gross commission at €56/P.
- The system calculates €56 reserve and €504 after reserve.
- An FB with €280 gross differential receives €28 reserve and €252 after reserve.
- The commission statement displays personal production and differential commission separately.

14.3 Hierarchy roll-up

- An employee’s production is attributed to their direct and indirect hierarchy according to effective-dated reporting relationships.
- A new subordinate added under an existing subordinate becomes part of the higher leader’s indirect structure.
- Changing a manager in the current hierarchy does not silently rewrite already approved historical commission statements.
- Each leader can drill into the production and commission records that contribute to their total, subject to permissions.

14.4 Career qualification

- An FB candidate with 100 total points and 7 KV points is not shown as qualified for FB because the 10 KV-point minimum is not met.
- After the candidate reaches at least 10 eligible KV points and all other requirements are met, the system can mark the target as qualification-ready.
- For a 750-point target with the 50% rule active, no more than 375 points from one structure are credited.
- At the end of a career period, only current-cycle promotion points reset; historical production and achieved level remain.
- The first career year uses the individual start date; later periods follow calendar-year cycles according to the confirmed transition rule.

14.5 Goals and lead workflows

- An employee can submit a monthly goal and a manager can approve or return it with a comment.
- Dashboard actuals update from validated production/activity records without double counting.
- A manager can assign a lead to an employee and the audit trail records who assigned it and when.
- Overdue lead follow-up appears in the relevant owner’s task list and the manager’s authorised overview.
- A lead converted to a customer/sale remains linked to its source and subsequent production when those identifiers are available.

14.6 Customer communications

- An email campaign respects opt-outs, suppression rules and the configured send window.
- Every attempted automated send has a log entry, including suppressed messages where relevant.
- An authorised user can preview and test-send a template before activation.
- A global pause prevents future automated sends while preserving the history.

15. Development Priorities and Phased Delivery

A phased approach reduces risk and makes it possible to validate Profina's rules before automating sensitive financial calculations.

Phase	Scope	Why it comes here
Phase 1 — Core foundation	Authentication; employees; hierarchy; career levels; effective-dated rules; production input/import; points and AE engine; career periods; KV qualification; 50% structure cap; audit trail.	All later features depend on reliable identities, structure and production calculations.
Phase 2 — Commission engine	Rate tables; personal commission; differential commission; 10% reserve; subsidy records; commission ledger; statements and reconciliation tools.	Financial outputs require tested production and hierarchy logic.
Phase 3 — Management cockpit	Personal/team dashboards; monthly goals; career simulator; structure drill-down; performance profiles; manager review workflows.	Uses the core data to improve daily leadership.
Phase 4 — Lead and task management	Lead intake, assignment, pipeline, activity logging, reminders, SLA alerts, conversion analytics and shared tasks.	Supports sales execution and makes activity measurable.
Phase 5 — Customer CRM	Customer list, customer profile, contract portal links/integration, communication preferences, service reminders and duplicate handling.	Builds on identity, access and task infrastructure.
Phase 6 — Retention automation and advanced analytics	Approved birthday/holiday emails, advanced forecasting, lead-source ROI, trend alerts, richer reporting and optional auto-assignment.	Requires stable data, legal review and reliable integrations.

Recommended delivery gates

- Gate A: Profina signs off on the written business rules and worked examples.
- Gate B: Unit tests prove all point, AE, career, KV, structure-cap and reserve calculations.
- Gate C: A small set of real-world cases is reconciled against Profina's current manual calculations.
- Gate D: Role-based access and audit logs are tested before importing live customer data.
- Gate E: Customer email automation remains disabled until templates, legal basis, suppression logic and approvals are verified.
- Gate F: A pilot with selected users is completed before organisation-wide rollout.

Avoid building advanced charts before the underlying calculations are trusted. A simple dashboard with correct numbers is more valuable than a polished dashboard with unverified figures.

16. Open Questions and Implementation Assumptions

The business logic captured here is detailed enough to start architecture and prototyping, but the following decisions should be confirmed before production release.

Topic	Current understanding	Decision required
Career-year transition	First year is personal; subsequent cycles use calendar years. Example: start 1 Nov 2026, first year ends around 1 Nov 2027, second regular cycle starts 1 Jan 2028.	Define the partial transition period and exact boundary timestamps.
Career point reset	Only promotion-cycle points reset; historical production remains.	Define whether any unused points from the partial transition period roll forward or expire.
KV qualification	At least 10% of target-level points must be KV points.	Confirm KV points count toward the overall point total and whether the test is applied after structure caps.
50% structure cap	From TL onward, maximum 50% of target-level requirement from each single structure.	Confirm it applies to every higher promotion and define what exactly constitutes a separate structure.
Differential calculation	Rate differences apply through the hierarchy; reserve applies to all differentials.	Approve a complete rate-pair matrix and define production attribution for every ancestor level.
Subsidy	Maximum by level; actual amount varies and must be covered by business volume.	Define coverage formula, approval process, payment timing, prorating and adjustment rules.
Point rounding	Formulas provided; 1 point = 28 AE.	Define decimal precision, display rounding, AE rounding and treatment of reversals.
Production status	Points are calculated from product details.	Define when production becomes eligible: submitted, issued, accepted, paid or another milestone.
Cancellations/changes	10% reserve exists; detailed cancellation mechanics not yet specified.	Define reserve release, clawback, cancellations, premium changes and adjustment workflow.
Hierarchy changes	Structure association is permanent in principle.	Define permitted transfers/exceptions and treatment of historical records.
Customer visibility	Central customer list is desired.	Define whether advisers see only their own customers, leaders see their hierarchy, or broader read-only access is allowed.
Contract portal	An existing portal reportedly shows contracts.	Identify portal, integration/API/export availability and authoritative source fields.
Email automation	Birthday and holiday emails desired.	Approve legal basis, preferences, templates, sending provider, suppression and retention rules.
Commission payment workflow	Gross commission less reserve is shown.	Define statement approval, export/payment reconciliation and finance permissions.
Other product remuneration	Electricity, gas and Kfz currently generate no points/AE; remuneration is out of scope for now.	Add separate commission rules later if required.

Implementation assumption

Until confirmed, unresolved rules should be configurable or marked as blocked decisions. Do not silently invent a business rule for a financial or career calculation. If a value cannot be calculated confidently, flag the record for authorised review and explain why.

17. Appendix — Worked Examples and Formula Reference

17.1 Point conversion examples

Product	Inputs	Calculation	Result
LV	€100 monthly; 35 years	100 × 12 × 35 ÷ 4,000	10.5 P
KV	€700 monthly	700 ÷ 28	25 P
Sach	€1,000 annual net premium	1,000 ÷ 200	5 P
Electricity / gas / Kfz	Any premium under current rule	No point conversion	0 P / 0 AE

17.2 Career thresholds and KV minimum

Target	Total points	Minimum KV points	AE equivalent
FB	100	10	2,800
TL	300	30	8,400
OL	750	75	21,000
DL	1,500	150	42,000
RL	4,000	400	112,000
VD	9,000	900	252,000

17.3 Personal commission examples

Scenario	Gross	10% reserve	After reserve
FB, 10 own points at €56/P	€560	€56	€504
FB, €28/P differential on 10 FA points	€280	€28	€252

17.4 Rate differences for known adjacent examples

Comparison	Calculation	Differential per point
FB over FA	€56 – €28	€28/P
TL over FB	€70 – €56	€14/P
OL over TL	€92 – €70	€22/P
DL over TL (example supplied)	€112 – €70	€42/P
RL over OL	€132 – €92	€40/P
VD over RL	€144 – €132	€12/P

Note: only the explicitly discussed examples should be treated as confirmed until Profina approves the complete commission matrix and exact attribution logic for each ancestor/descendant combination.

17.5 Minimum dashboard definitions

- Personal points: eligible production credited directly to the employee in the selected period.
- Team production: actual production generated by all employees within the permitted hierarchy scope; do not confuse with promotion-eligible points after caps.
- Promotion-eligible points: current-cycle points remaining after applicable career attribution and structure-cap rules.
- KV points: points tagged as health-insurance production and eligible under the career rules.

- Gross commission: sum of gross commission ledger entries for the selected scope and period.
- Reserve: 10% of the applicable commission amount, shown separately.
- After-reserve amount: gross commission minus reserve, before other deductions or adjustments.
- Appointment-to-sale conversion: sales attributed to the defined appointment cohort divided by held appointments in that cohort; document the attribution window.

End of specification

This document is the starting business and technical specification for the Profina Sales & Management System. The next step is to confirm the open decisions, validate examples against Profina’s current calculation practice, and turn the requirements into user stories, data schemas, test cases and an implementation plan.
